HYDROXYMORPHOLINONE DERIVATIVE AND MEDICINAL USE THEREOF**Technical Field**

The present invention relates to a novel
5 hydroxymorpholinone derivative having a calpain inhibitory
activity. More particularly, the present invention relates to
a medicine containing a novel hydroxymorpholinone derivative.

Background Art

Calpain is one of the proteolytic enzymes in cytoplasm,
10 which are distributed widely in living organisms, and
activated by a calcium ion. At present, it has been clarified
that abnormal activation of this calpain is involved in
various diseases such as stroke, subarachnoid hemorrhage,
Alzheimer's disease, ischemic disease, muscular dystrophy,
15 cataract, platelet aggregation, arthritis and the like [Trends
in Pharmacological Sciences, vol. 15, p. 412 (1994)]. On the
other hand, it has been clarified that a calpain inhibitor is
effective for maintaining transparency of a lens in an
experimental cataract model by way of lens culture [Curr. Eye
20 Res., vol. 10, pp. 657-666 (1994)], and useful as a
therapeutic agent for cataract (W093/23032) and the like. As
calpain inhibitors reported heretofore, peptide halomethane
derivative (JP-B-6-29229), peptide diazomethane derivative
[Biochem. J., vol. 253, pp. 751-758 (1988), J. Med. Chem., vol.
25 35, pp. 216-220 (1992)], peptidyl aldehyde derivative
(EP771565, USP6057290 and the like) and the like can be
mentioned. However, as the situation stands, these inhibitors
have not been put to practice.

Disclosure of the Invention

30 The present inventors have conducted intensive studies
in an attempt to provide a compound having a calpain
inhibitory activity, created a compound having a strong
calpain inhibitory activity, and further studied to complete
the present invention.

Accordingly, the present invention relates to

(1) a compound represented by the formula (I)

wherein R^1 and R^2 are each a lower alkyl group optionally
5 having substituents, or a salt thereof,

(2) the compound of the above-mentioned (1), wherein R^2 is a lower alkyl group substituted by an aromatic hydrocarbon group, or a salt thereof,

(3) a compound represented by the formula (I)

10 wherein R^1 is a lower alkyl group optionally having substituents, R^2 is a lower alkyl group, or a salt thereof,

(4) the compound of the above-mentioned (3), wherein R^2 is a lower alkyl group having 3 or 4 carbon atoms, or a salt
15 thereof,

(5) the compound of the above-mentioned (4), wherein the lower alkyl group is isopropyl or isobutyl, or a salt thereof,

(6) the compound of any of the above-mentioned (1)-(5), wherein R^1 is a lower alkyl group having substituent(s), or a
20 salt thereof,

(7) the compound of the above-mentioned (6), wherein the substituent(s) that the lower alkyl group has is an aromatic hydrocarbon group optionally having substituents, or a salt thereof,

25 (8) the compound of the above-mentioned (7), wherein the aromatic hydrocarbon group is an aromatic hydrocarbon group

substituted by a group selected from the group consisting of a hydroxy group, a lower alkoxy group, a cyclohexylmethoxy group, a halogen atom and a phenyl group,

(9) the compound of the above-mentioned (7) or (8), wherein
5 the aromatic hydrocarbon group is a phenyl group or 2-naphthyl group,

(10) (2S,5S)-5-Benzyl-6-hydroxy-2-(2-methylpropyl)-3-morpholinone,

(11) a medicine comprising a compound represented by the
10 formula (I)

wherein R^1 and R^2 are each a lower alkyl group optionally having substituents, or a salt thereof,

(12) the medicine of the above-mentioned (11), which is a
15 calpain inhibitor,

(13) the medicine of the above-mentioned (12), which is an agent for the prophylaxis or treatment of a disease in which calpain is involved,

(14) a pharmaceutical composition comprising a compound
20 represented by the formula (I)

wherein R^1 and R^2 are each a lower alkyl group optionally having substituents, or a salt thereof and a pharmaceutically acceptable carrier,

25 (15) the pharmaceutical composition of the above-mentioned (14), which is a calpain inhibitor,

(16) a method for treating a disease in which calpain is involved, which comprises administering an effective amount of a compound represented by the formula (I)

5 wherein R¹ and R² are each a lower alkyl group optionally having substituents, or a salt thereof, to a mammal in need of the treatment, and

(17) use of a compound represented by the formula (I)

10 wherein R¹ and R² are each a lower alkyl group optionally having substituents, or a salt thereof, as a calpain inhibitor.

In the present specification, the "lower alkyl group" means a linear or branched alkyl group having 1 to 6 carbon atoms (e.g., methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl, tert-butyl, pentyl, isopentyl, neopentyl, tert-pentyl, hexyl, 2-methylpentyl, 3-methylpentyl, 4-methylpentyl, 2,2-dimethylbutyl, 3,3-dimethylbutyl, 2-ethylbutyl and the like), "aromatic hydrocarbon group" means a monocyclic or condensed polycyclic aromatic hydrocarbon group having 6 to 10 carbon atoms, (e.g., phenyl, naphthyl, 2-naphthyl and the like), "alicyclic hydrocarbon group" means a monocyclic or condensed polycyclic alicyclic hydrocarbon group having 3 to 10 carbon atoms (e.g., cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl and the like), and "heterocyclic group" means a
 25 monocyclic or condensed polycyclic aromatic or non-aromatic heterocyclic group having 1 or 2 nitrogen atoms and/or one

sulfur atom and/or one oxygen atom (e.g., 3-indolyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, 2-imidazolyl, 4-imidazolyl, 5-imidazolyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyrrolyl, 3-pyrrolyl, 2-quinolyl, isoquinolyl and the like).

5 In the above-mentioned formula (I), as the lower alkyl group represented by R^1 , the above-mentioned alkyl group can be mentioned. Preferred is alkyl having 1 to 4 carbon atoms, and particularly preferred is methyl, ethyl, propyl and butyl.

As the lower alkyl group represented by R^2 , the above-
10 mentioned alkyl group can be mentioned. Preferred is alkyl having 1 to 4 carbon atoms, particularly preferred is alkyl group having 3-4 carbon atoms, and most preferred is isopropyl and isobutyl.

As the substituents that the lower alkyl group
15 represented by R^1 and R^2 may have, for example, the following groups 1)-19) can be mentioned:

1) aromatic hydrocarbon group optionally having substituents [e.g., phenyl group, 2-naphthyl group and the like: as the substituents, for example, a hydroxy group, a lower alkoxy
20 group (e.g., linear or branched alkoxy group having 1 to 6 carbon atoms such as methoxy, ethoxy, propoxy, isopropoxy, butoxy, sec-butoxy, tert-butoxy, pentyloxy, isopentyloxy, hexyloxy and the like can be mentioned, which is preferably an alkoxy group having 1 to 4 carbon atoms, and particularly
25 preferably methoxy and butoxy), a cyclohexylmethoxy group, a halogen atom (e.g., fluorine, chlorine, bromine, iodine and the like can be mentioned, with preference given to fluorine and chlorine), an aryl group (e.g., phenyl group and the like), and the like];

30 2) an alicyclic hydrocarbon group;

3) a heterocyclic group;

4) an oxy group having any of a hydrogen atom, an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group [e.g., hydroxy, aryloxy (phenoxy, naphthoxy,

2-naphthoxy and the like), alkoxy (cyclohexyloxy and the like),
3-indolyloxy, 2-pyridyloxy, 3-pyridyloxy, 4-pyridyloxy, 2-
imidazolyloxy, 4-imidazolyloxy, 5-imidazolyloxy and the like];
5) an oxy group having a lower alkyl group optionally
5 substituted by any of an aromatic hydrocarbon group, an
alicyclic hydrocarbon group and a heterocyclic group [e.g.,
alkoxy (methoxy, ethoxy, propoxy, butoxy, pentyloxy, hexyloxy,
cyclohexylmethoxy and the like), aralkyloxy (benzyloxy,
phenylethoxy, naphthylmethoxy, 2-naphthylmethoxy, 2-
10 naphthylethoxy and the like), 3-indolyloxy, 2-
pyridylmethoxy, 3-pyridylethoxy, 4-pyridylpropoxy, 2-
imidazolyloxy, 4-imidazolyloxy, 5-imidazolyloxy and
the like];
6) a carbamoyl group optionally substituted by any of an
15 aromatic hydrocarbon group, an alicyclic hydrocarbon group and
a heterocyclic group (e.g., carbamoyl, phenylcarbamoyl,
naphthylcarbamoyl, cyclohexylcarbamoyl, 3-indolylcarbamoyl, 2-
pyridylcarbamoyl, 3-pyridylcarbamoyl, 4-pyridylcarbamoyl, 2-
imidazolylcarbamoyl, 4-imidazolylcarbamoyl, 5-
20 imidazolylcarbamoyl and the like);
7) a carbamoyl group having a lower alkyl group optionally
substituted by any of an aromatic hydrocarbon group, an
alicyclic hydrocarbon group and a heterocyclic group (e.g.,
methylcarbamoyl, ethylcarbamoyl, propylcarbamoyl,
25 butylcarbamoyl, pentylcarbamoyl, hexylcarbamoyl,
benzylcarbamoyl, phenethylcarbamoyl, naphthylmethylcarbamoyl,
2-naphthylethylcarbamoyl, cyclohexylmethylcarbamoyl, 3-
indolylethylcarbamoyl, 2-pyridylmethylcarbamoyl, 3-
pyridylethylcarbamoyl, 4-pyridylpropylcarbamoyl, 2-
30 imidazolylmethylcarbamoyl, 4-imidazolylethylcarbamoyl, 5-
imidazolylpropylcarbamoyl and the like);
8) a carboxy group optionally esterified by any of an aromatic
hydrocarbon group, an alicyclic hydrocarbon group and a
heterocyclic group (e.g., carboxy, phenoxycarbonyl,

- naphthoxycarbonyl, 2-naphthoxycarbonyl, cyclohexyloxycarbonyl, 3-indolyloxycarbonyl, 2-pyridyloxycarbonyl, 3-pyridyloxycarbonyl, 4-pyridyloxycarbonyl, 2-imidazolyloxycarbonyl, 4-imidazolyloxycarbonyl, 5-imidazolyloxycarbonyl and the like);
- 9) a carboxy group esterified by a lower alkyl group optionally substituted by any of an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., methoxycarbonyl, ethoxycarbonyl, propoxycarbonyl, butoxycarbonyl, pentyloxycarbonyl, hexyloxycarbonyl, benzyloxycarbonyl, phenylethoxycarbonyl, naphthylmethoxycarbonyl, 2-naphthylmethoxycarbonyl, 2-naphthylethoxycarbonyl, cyclohexylmethoxycarbonyl, 3-indolylethoxycarbonyl, 2-pyridylmethoxycarbonyl, 3-pyridylethoxycarbonyl, 4-pyridylpropoxycarbonyl, 2-imidazolylmethoxycarbonyl, 4-imidazolylethoxycarbonyl, 5-imidazolylpropoxycarbonyl and the like);
- 10) a sulfanyl group optionally substituted by any of an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., sulfanyl, phenylsulfanyl, naphthylsulfanyl, cyclohexylsulfanyl, 3-indolylsulfanyl, 2-pyridylsulfanyl, 3-pyridylsulfanyl, 4-pyridylsulfanyl, 2-imidazolylsulfanyl, 4-imidazolylsulfanyl, 5-imidazolylsulfanyl and the like);
- 11) a sulfanyl group having a lower alkyl group optionally substituted by any of an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., methylsulfanyl, ethylsulfanyl, propylsulfanyl, butylsulfanyl, pentylsulfanyl, hexylsulfanyl, benzylsulfanyl, phenethylsulfanyl, naphthylmethylsulfanyl, 2-naphthylethylsulfanyl, cyclohexylmethylsulfanyl, 3-indolylethylsulfanyl, 2-pyridylmethylsulfanyl, 3-pyridylethylsulfanyl, 4-pyridylpropylsulfanyl, 2-imidazolylmethylsulfanyl, 4-imidazolylethylsulfanyl, 5-

imidazolylpropylsulfanyl and the like);

12) an amino group optionally substituted by any of an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., amino, anilino, naphthylamino, cyclohexylamino, 3-indolylamino, 2-pyridylamino, 3-pyridylamino, 4-pyridylamino, 2-imidazolylamino, 4-imidazolylamino, 5-imidazolylamino and the like);

13) an amino group having a lower alkyl group optionally substituted by any of an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., methylamino, ethylamino, propylamino, butylamino, pentylamino, hexylamino, benzylamino, phenethylamino, naphthylmethylamino, 2-naphthylethylamino, cyclohexylmethylamino, 3-indolyloethylamino, 2-pyridylmethylamino, 3-pyridylethylamino, 4-pyridylpropylamino, 2-imidazolylmethylamino, 4-imidazolylethylamino, 5-imidazolylpropylamino and the like);

14) an acylamino group having any of an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., benzoylamino, naphthoylamino, 2-naphthoylamino, cyclohexylcarboxamide, 3-indolylcarboxamide, 2-pyridylcarboxamide, 3-pyridylcarboxamide, 4-pyridylcarboxamide, 2-imidazolylcarboxamide, 4-imidazolylcarboxamide, 5-imidazolylcarboxamide and the like);

15) an acylamino group having a lower alkyl group optionally substituted by any of an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., acetylamino, propionylamino, butyrylamino, isobutyrylamino, valerylamino, isovalerylamino, pivaloylamino, hexanoylamino, heptanoylamino, phenylacetylamino, phenylpropionylamino, naphthylacetylamino, naphthylpropionylamino, cyclohexylacetylamino, 3-indolylpropionylamino, 2-pyridylacetylamino, 3-pyridylpropionylamino, 4-pyridylbutyrylamino, 2-imidazolylacetylamino, 4-imidazolylpropionylamino, 5-imidazolylbutyrylamino and the

like);

- 16) a sulfonylamino group having any of aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., benzenesulfonylamino, naphthalenesulfonylamino, 2-
5 naphthalenesulfonylamino, cyclohexylsulfonylamino, 3-indolylsulfonylamino, 2-pyridylsulfonylamino, 3-pyridylsulfonylamino, 4-pyridylsulfonylamino, 2-imidazolylsulfonylamino, 4-imidazolylsulfonylamino, 5-imidazolylsulfonylamino and the like);
- 10 17) a sulfonylamino group having a lower alkyl group optionally substituted by any of an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., mesylamino, ethylsulfonylamino, propylsulfonylamino, butylsulfonylamino, pentylsulfonylamino, hexylsulfonylamino,
15 benzylsulfonylamino, phenethylsulfonylamino, naphthylmethylsulfonylamino, 2-naphthylethylsulfonylamino, cyclohexylmethylsulfonylamino, 3-indolylethylsulfonylamino, 2-pyridylmethylsulfonylamino, 3-pyridylethylsulfonylamino, 4-pyridylpropylsulfonylamino, 2-imidazolylmethylsulfonylamino,
20 4-imidazolylethylsulfonylamino, 5-imidazolylpropylsulfonylamino and the like);
- 18) a ureido group optionally substituted by any of an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., ureido, phenylureido,
25 naphthylureido, 2-naphthylureido, cyclohexylureido, 3-indolylureido, 2-pyridylureido, 3-pyridylureido, 4-pyridylureido, 2-imidazolylureido, 4-imidazolylureido, 5-imidazolylureido and the like); and
- 19) a ureido group having a lower alkyl group optionally
30 substituted by any of an aromatic hydrocarbon group, an alicyclic hydrocarbon group and a heterocyclic group (e.g., methylureido, ethylureido, propylureido, butylureido, pentylureido, hexylureido, benzylureido, phenethylureido, naphthylmethylureido, 2-naphthylethylureido,

cyclohexylmethylureido, 3-indolylethylureido, 2-pyridylmethylureido, 3-pyridylethylureido, 4-pyridylpropylureido, 2-imidazolylmethylureido, 4-imidazolylethylureido, 5-imidazolylpropylureido and the like).

5 Even when particularly mentioned in the above, the above-mentioned aromatic hydrocarbon group, alicyclic hydrocarbon group, heterocyclic group and lower alkyl group may have a substituent (e.g., alkyl group, acyl group, oxo group, optionally esterified carboxy group, optionally
10 substituted amino group, optionally substituted hydroxy group, optionally substituted sulfanyl group, halogen atom, nitro group and the like) at a synthesizable and substitutable position thereof.

As the substituent that the lower alkyl group
15 represented by R^1 has, an aromatic hydrocarbon group optionally having substituents, an aralkyloxy group and an acylamino group having an aromatic hydrocarbon group are particularly preferably. Particularly, phenyl, 2-naphthyl and a phenyl group substituted by a hydroxy group, a lower alkoxy group
20 (particularly, methoxy, ethoxy, propoxy, butoxy), a cyclohexylmethoxy group, a halogen atom (particularly, fluorine, chlorine) and a phenyl group are preferable.

As the substituent that the lower alkyl group represented by R^2 has, an aromatic hydrocarbon group is
25 preferable and a phenyl group is particularly preferable.

Moreover, the present invention encompasses compounds represented by the formula (I) and salts thereof (hereinafter sometimes to be referred to as the compound of the present invention), and various solvates, crystalline polymorphs and
30 prodrugs of the compound of the present invention. As the salt of the compound of the present invention, a physiologically acceptable salt is preferable, such as a salt with an inorganic base, a salt with an organic base, a salt with an inorganic acid, a salt with an organic acid, a salt with a

basic or acidic amino acid and the like. As preferable examples of a salt with an inorganic base, for example, alkali metal salts such as sodium salt, potassium salt and the like; alkaline earth metal salts such as calcium salt, magnesium salt and the like; and aluminum salt, ammonium salt and the like can be mentioned. As preferable examples of a salt with an organic base, for example, salts with trimethylamine, triethylamine, pyridine, picoline, ethanolamine, diethanolamine, triethanolamine, dicyclohexylamine, N,N'-dibenzylethylenediamine and the like can be mentioned. As preferable examples of a salt with an inorganic acid, for example, salts with hydrochloric acid, hydrobromic acid, nitric acid, sulfuric acid, phosphoric acid and the like can be mentioned. As preferable examples of a salt with an organic acid, for example, salts with formic acid, acetic acid, trifluoroacetic acid, fumaric acid, oxalic acid, tartaric acid, maleic acid, citric acid, succinic acid, malic acid, methanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid and the like can be mentioned. As preferable examples of a salt with a basic amino acid, for example, salts with arginine, lysine, ornithine and the like can be mentioned, and as preferable examples of a salt with an acidic amino acid, for example, salts with aspartic acid, glutamic acid and the like can be mentioned.

25 The compound of the present invention can be prepared by, for example, from the following reaction scheme:

wherein each symbol is as defined above. By a reaction comprising introducing a protecting group represented by R^3 into an amino group of amino alcohol of a compound represented by the formula (II) [hereinafter sometimes to be referred to as Compound (II)], a compound represented by the formula (III) [hereinafter sometimes to be referred to as Compound (III)] can be obtained. As the protecting group represented by R^3 , those generally used in the field of peptide synthesis such as benzyloxycarbonyl group (hereinafter sometimes to be referred to as Z group), 9-fluorenylmethoxycarbonyl group (hereinafter sometimes to be referred to as Fmoc group), tert-butoxycarbonyl group (hereinafter sometimes to be referred to as Boc group) and the like can be mentioned. When Z group is used as a protecting group, for example, Compound (II) is dissolved in an organic solvent generally used [e.g., a conventional solvent that does not adversely influence the reaction such as tetrahydrofuran (THF), dichloromethane, N,N-dimethylformamide (DMF), ethyl acetate and the like or a mixed solvent thereof] in the presence or absence of a suitable base and N-carbobenzoxysuccinimide is added to give Compound (III). While the reaction temperature is not particularly limited, it is generally under cooling, room temperature or under heating, preferably in the range of from under ice-

cooling to room temperature. When Fmoc group is used as a protecting group, moreover, a similar treatment as in the case of Z group is applied using N-(9-fluorenylmethoxycarbonyloxy)succinimide to give Compound (III).

5 A compound represented by the formula (IV) [hereinafter sometimes to be referred to as Compound (IV)] can be obtained by oxidization reaction of Compound (III). AS the oxidization method, for example, a method known per se can be used, such as pyridinium dichromate (PDC) oxidation, pyridinium
10 chlorochromate (PCC) oxidation, Jones oxidation and Collins oxidation classified as chromic acid oxidization, or Swern oxidation, oxidization by a DMSO-sulfur trioxide pyridine complex, oxidization by DMSO-DCC and oxidization by DMSO-oxalyl chloride classified as dimethylsulfoxide (DMSO)
15 oxidization, or oxidization by hypohalogen acid, oxidization by N-halogenocarboxamide and the like, with preference given to oxidization by a DMSO-sulfur trioxide pyridine complex. A oxidization reaction using a DMSO-sulfur trioxide pyridine complex can be carried out by dissolving Compound (III) in
20 DMSO or a mixed solvent of DMSO and an organic solvent generally used (e.g., tetrahydrofuran, dichloromethane, ethyl acetate and the like), and adding a sulfur trioxide pyridine complex in the presence of a base such as diisopropylethylamine, triethylamine and the like. While the
25 reaction temperature is not particularly limited, it is generally under cooling, room temperature or under heating, preferably in the range of from under ice-cooling to room temperature.

 A compound represented by the formula (V) [hereinafter
30 sometimes to be referred to as Compound (V)] is a compound wherein aldehyde of Compound (IV) is protected by forming a cyclic acetal with ethylene glycol. This reaction can be carried out by dissolving Compound (IV) in an organic solvent generally used, adding ethylene glycol and stirring in the

presence of p-toluenesulfonic acid-pyridine-salt. As the organic solvent generally used, for example, a conventional solvent that does not adversely influence the reaction, such as N,N-dimethylformamide, dimethyl sulfoxide, tetrahydrofuran, 5 dichloromethane, methanol, ethanol, benzene, toluene, ethyl acetate and the like, or a mixed solvent thereof can be mentioned, with preference given to toluene. The amount of ethylene glycol to be used is about 1 - about 20-fold, preferably about 3 - about 6-fold, equivalent to Compound (IV).

10 It is also possible to carry out a similar reaction using ethanol instead of ethylene glycol and form diethylacetal to protect aldehyde of Compound (IV). In addition, a similar reaction can be carried out using an organic acid such as p-toluenesulfonic acid, trifluoroacetic acid, acetic acid, 15 formic acid and the like or an inorganic acid such as hydrochloric acid, hydrobromic acid, sulfuric acid and the like, which are generally used as acid catalyst, instead of p-toluenesulfonic acid-pyridine-salt. The reaction temperature is about 20 - about 200°C, preferably about 50 - about 150°C.

20 For a compound represented by the formula (VI) [hereinafter sometimes to be referred to as Compound (VI)], R^3 , which is a protecting group of Compound (V), can be dissociated by selecting an appropriately method for the protecting group used and applying a conventional method 25 employed for dissociation reaction of an amino-protecting group. For example, when R^3 is a Z group, it is performed by a catalytic reduction in the presence of a conventional metal catalyst (e.g., palladium carbon, Raney-nickel and the like). The reaction temperature is not particularly limited as long 30 as unpreferable side reaction does not occur, and the reaction is generally carried out under cooling, at room temperature or under heating. When R^3 is a Fmoc group, R^3 can be dissociated by stirring in the presence of a conventional basic reagent (e.g., piperidine, morpholine, triethylamine, sodium hydroxide,

piperidine polymer and the like). While the reaction temperature is not particularly limited, it is generally under cooling, room temperature or under heating, preferably in the range of from under ice-cooling to room temperature. When R³ is a Boc group, R³ can be dissociated by dissolving Compound (V) in an organic solvent generally used (e.g., a conventional solvent that does not adversely influence the reaction such as tetrahydrofuran, dichloromethane, ethyl acetate and the like, or a mixed solvent thereof) and stirring in the presence of an acid. As the acid, hydrochloric acid, trifluoroacetic acid, p-toluenesulfonic acid and the like can be mentioned. In addition, a solution of commercially available hydrochloric acid in ethyl acetate or dioxane, and the like can be used for dissociation. While the reaction temperature is not particularly limited, it is generally under cooling, room temperature or under heating, preferably in the range of from under ice-cooling to room temperature. Compound (VI) may be used for the next reaction without isolation and purification as long as it does not influence the next reaction.

A compound represented by the formula (VIII) [hereinafter sometimes to be referred to as Compound (VIII)] can be obtained by an amidation reaction of Compound (VI) and a compound represented by the formula (VII) or a salt thereof or a reactive derivative thereof. This amidation reaction is carried out by a general method of peptide synthesis using a dehydration condensation agent and the like. As a preferable reactive derivative, an acid halide, an acid anhydride, an active amide, an active ester and the like can be mentioned. As preferable examples of the reactive derivatives, acid chloride; acid azide; mixed acid anhydrides with acid such as substituted phosphoric acid (e.g., dialkylphosphoric acid, phenylphosphoric acid, diphenylphosphoric acid, dibenzylphosphoric acid, phosphoric acid halide and the like), dialkyl phosphite, sulfurous acid, thiosulfuric acid, sulfuric

acid, sulfonic acid (e.g., methanesulfonic acid and the like), aliphatic carboxylic acid (e.g., acetic acid, propionic acid, butyric acid, isobutyric acid, pivalic acid, pentane acid, isopentane acid, trichloroacetic acid and the like) or
5 aromatic carboxylic acid (e.g., benzoic acid and the like); symmetric acid anhydride; active amide with imidazole, 4-substituted imidazole, dimethylpyrazole, triazole or tetrazole; or active esters (e.g., cyanomethyl ester, methoxymethyl ester, dimethyliminomethyl ester, vinyl ester,
10 propargyl ester, p-nitrophenyl ester, trichlorophenyl ester, pentachlorophenyl ester, mesylphenyl ester, phenylazophenyl ester, phenyl thioester, p-nitrophenyl thioester, p-cresyl thioester, carboxymethyl thioester, pyranyl ester, pyridyl ester, piperidyl ester, 8-quinolyl thioester and the like), or
15 an ester with an N-hydroxy compound (e.g., N,N-dimethylhydroxylamine, 1-hydroxy-2-(1H)-pyridone, N-hydroxysuccinimide, N-hydroxyphthalimide, 1-hydroxybenzotriazole and the like); and the like can be mentioned, with preference given to 1-hydroxybenzotriazole. As
20 the dehydration condensation agent, 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride or, N,N-dicyclohexylcarbodiimide and the like are preferably used. As the organic solvent to be used for the reaction, N,N-dimethylformamide, dimethyl sulfoxide, tetrahydrofuran,
25 dichloromethane, methanol, ethanol, benzene, toluene, ethyl acetate, a mixed solvent thereof and the like can be mentioned, with preference given to N-dimethylformamide. The reaction temperature is not particularly limited as long as unpreferable side reaction does not occur, and is generally
30 under cooling, at room temperature or under heating, with preference given to the range of from under ice-cooling to room temperature.

A compound represented by the formula (I) can be obtained by deacetal reaction of Compound (VIII). This

deacetal reaction can be carried out by dissolving Compound (VIII) in an organic solvent generally used or a mixed solvent of an organic solvent and water, adding an acid and stirring the mixture. As the acid to be used, organic acids such as p-toluenesulfonic acid, trifluoroacetic acid, acetic acid, formic acid and the like, and inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid and the like can be mentioned, with particular preference given to hydrochloric acid. A preferable concentration of hydrochloric acid is about 1M - about 6M. The reaction temperature is not particularly limited and the reaction is carried out under cooling, at room temperature or under heating. The reaction time is about 1-about 48 hr. The thus-obtained hydroxymorpholinone derivative can be isolated or purified by known separation or purification means, such as concentration, concentration under reduced pressure, solvent extraction, crystallization, recrystallization, phase transfer, chromatography and the like.

As the compound prepared as mentioned above, for example, (2S,5S)-5-benzyl-6-hydroxy-2-(2-methylpropyl)-3-morpholinone, (2S,5S)-6-hydroxy-2-(2-methylpropyl)-5-(2-phenylethyl)-3-morpholinone, (2S,5S)-6-hydroxy-2-(2-methylpropyl)-5-(2-naphthylmethyl)-3-morpholinone, (2S,5R)-5-benzyl-6-hydroxy-2-(2-methylpropyl)-3-morpholinone, (2S,5S)-5-benzyl-6-hydroxy-2-(1-methylethyl)-3-morpholinone, (2S,5S)-6-hydroxy-2-(1-methylethyl)-5-(2-phenylethyl)-3-morpholinone, (2S,5S)-2,5-dibenzyl-6-hydroxy-3-morpholinone, (2S,5S)-6-hydroxy-5-((4-hydroxyphenyl)methyl)-2-(2-methylpropyl)-3-morpholinone, (2S,5S)-6-hydroxy-5-((4-methoxyphenyl)methyl)-2-(2-methylpropyl)-3-morpholinone, (2S,5S)-5-((4-butoxyphenyl)methyl)-6-hydroxy-2-(2-methylpropyl)-3-morpholinone, (2S,5S)-5-((4-(cyclohexylmethoxy)phenyl)methyl)-6-hydroxy-2-(2-methylpropyl)-3-morpholinone, (2S,5S)-5-((2-fluorophenyl)methyl)-6-hydroxy-2-(2-methylpropyl)-3-

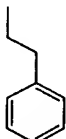

morpholinone, (2S,5S)-5-((2-chlorophenyl)methyl)-6-hydroxy-2-(2-methylpropyl)-3-morpholinone, (2S,5S)-5-benzyloxymethyl-6-hydroxy-2-(2-methylpropyl)-3-morpholinone, (2S,5S)-5-((4-biphenyl)methyl)-6-hydroxy-2-(2-methylpropyl)-3-morpholinone, 5 (2S,5S)-5-(4-(benzoylamino)butyl)-6-hydroxy-2-(2-methylpropyl)-3-morpholinone and the like can be mentioned. Particularly preferred is (2S,5S)-5-benzyl-6-hydroxy-2-(2-methylpropyl)-3-morpholinone.

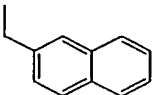

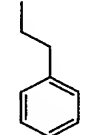

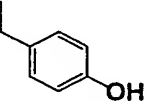

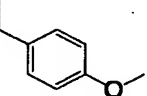

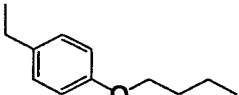

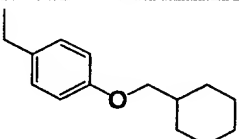

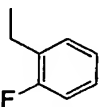

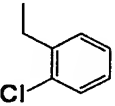

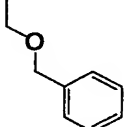

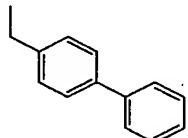

While the compound of the present invention has a 10 stereoisomer, the compound of the present invention encompasses all the isomers and a mixture of such isomers.

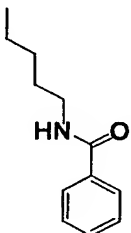

The compound of the present invention is a novel compound that has not been described in any reference and, since it has a superior calpain inhibitory activity as shown 15 in Experimental Examples below, the compound is useful as a medicine as a calpain inhibitor obtained by combining the compound as an active ingredient with a below-mentioned carrier and the like as necessary. The structural formulas of the compounds disclosed in Examples mentioned below are shown 20 in Table 1.

A medicine containing the compound of the present invention is useful as a drug for the prophylaxis or treatment of diseases in which calpain is involved, such as ischemic disease, immunity disease, Alzheimer's disease, osteoporosis, ischemic brain disease, cataract, glaucoma, retinal (choroidal) disease, complications of posterior segment of the eye arising from photocoagulation (e.g., macular edema, retinal detachment and the like) and the like, or a drug for the suppression or treatment of angiogenesis and the like, in mammals (e.g., human, rat, mouse, rabbit, bovine, pig, dog, cat and the like). In addition, since the compounds of the present invention are mostly superior to the same kind of conventional compounds in water solubility, which makes it possible to use the inventive compound as an aqueous liquid conventionally difficult to provide. Moreover, the compound of the present invention is superior in penetration to tissue and absorbability, shows extremely low toxicity and is superior in safety.

A medicine containing the compound of the present invention can be administered systemically or topically. For systemic administration, it is administered orally or parenterally by intravenous injection, subcutaneous injection, intramuscular injection and the like. Topically, it is administered dermally, mucosally, intranasally, intraocularly and the like.

As a dosage form of a medicine containing the compound of the present invention, solid agents such as powder, granule,

tablet, capsule, suppository and the like, liquids such as syrup, injection, eye drop, nose drop and the like, and the like can be mentioned. For preparation of granule or tablet, for example, any dosage form is available by the use of

5 excipients (lactose, sucrose, glucose, starch, crystalline cellulose and the like), lubricants (magnesium stearate, talc, stearic acid, calcium stearate and the like), disintegrants (starch, carmellose sodium, calcium carbonate and the like), binders (starch liquid, hydroxypropyl cellulose liquid,

10 carmellose liquid, gum arabic liquid, gelatin liquid, sodium alginate liquid and the like) and the like. For granule and tablet, a coating may be formed with a suitable coating agent (gelatin, sucrose, gum arabic, carnauba wax and the like), an enteric coating agent (e.g., cellulose acetate phthalate,

15 methacrylic acid copolymer, hydroxypropyl cellulose phthalate, carboxymethylethylcellulose and the like) and the like.

For preparation of a capsule, suitable excipients, such as magnesium stearate, calcium stearate, talc, light anhydrous silicic acid and the like for improving fluidity and

20 lubrication, crystalline cellulose, lactose and the like for compression fluidity, as well as the above-mentioned disintegrant and the like are appropriately added and uniformly admixed or processed into granules or a granular form, a coating is formed with a suitable coating agent, and

25 the resulting product is filled in a capsule, or can be encapsulation formed with a capsule base obtained by adding glycerol, sorbitol and the like to a suitable capsule base (gelatin and the like) to increase plasticity. These capsules can contain a coloring agent, a preservative [sulfur dioxide,

30 parabens (methyl p-hydroxybenzoate, ethyl p-hydroxybenzoate, propyl p-hydroxybenzoate)] and the like as necessary. Capsule can also be prepared into a conventional capsule, as well as an enteric coated capsule, an intragastric resistance capsule or a sustained release capsule. When an enteric capsule is to

be prepared, a compound or a compound containing the above-mentioned suitable excipients, which has been coated with an enteric coating agent, is filled in a conventional capsule or a capsule itself may be coated with an enteric coating agent, 5 or an enteric polymer may be used as a base to be formed.

When a suppository is to be prepared, a suppository base (e.g., cacao butter, macrogol and the like) can be appropriately selected and used.

When a syrup is to be prepared, for example, a 10 stabilizer (disodium edetate and the like), a suspending agent (gum arabic, carmellose and the like), a corrigent (simple syrup, glucose and the like), an aromatic and the like can be appropriately selected and used.

When an injection, an eye drop or a nose drop is to be 15 prepared, it can be prepared by dissolving or dispersing the compound in a solution appropriately containing a pharmaceutically acceptable additive, such as an isotonicity agent (sodium chloride, potassium chloride, glycerol, mannitol, sorbitol, boric acid, borax, glucose, propylene glycol and the 20 like), a buffer (phosphate buffer, acetate buffer, borate buffer, carbonate buffer, citrate buffer, Tris buffer, glutamic acid, epsilon aminocaproic acid and the like), a preservative (p-hydroxybenzoic acid esters, chlorobutanol, benzyl alcohol, benzalkonium chloride, sodium dehydroacetate, 25 disodium edetate, boric acid, borax and the like), a thickener (hydroxyethylcellulose, hydroxypropylcellulose, polyvinyl alcohol, polyethylene glycol and the like), a stabilizer (sodium bisulfite, sodium hyposulfite, disodium edetate, sodium citrate, ascorbic acid, dibutylhydroxytoluene and the 30 like), a pH adjusting agent (hydrochloric acid, sodium hydroxide, phosphoric acid, acetic acid and the like) and the like.

Of the compounds of the present invention, a compound having suitable water-solubility desired as a pharmaceutical

product can be advantageously used as a water-soluble liquid particularly for the above-mentioned pharmaceutical preparations such as syrup, injection, eye drop, nose drop and the like.

5 While the amount of the additive to be contained in the above-mentioned syrup, injection, eye drop or nose drop varies depending on the kind, use and the like of the additive to be used, it needs only to be added at a concentration capable of achieving the object of the additive, wherein an isotonicity
10 agent is generally added at about 0.5 - about 5.0 w/v% to make the osmotic pressure about 229 - about 343 mOsm. A buffer is added at about 0.01 - about 2.0 w/v%; a thickener is added at about 0.01 - about 1.0 w/v%; and a stabilizer is added at about 0.001 - about 1.0 w/v%. A pH adjusting agent is added as
15 appropriate and generally adjusted to about pH 3 - about 9, preferably about 4 - about 8.

 While the dose of the compound of the present invention varies depending on the target disease, condition, subject of administration, administration method and the like, for
20 example, in the case of a medicine for internal use, a single dose of about 1 - about 200 mg, preferably about 10 - about 100 mg, is administered to an adult several times a day. In the case of an injection, about 0.1 - about 50 mg, preferably about 1 - about 30 mg, is administered to an adult once a day.
25 For topical use to the eye, an eye drop containing about 0.001 - about 1.0 w/v%, preferably about 0.01 - about 0.5 w/v%, of the compound of the present invention is generally distilled into the eye several times a day by about 20 - about 50 μ L for one distillation.

5 **Best Mode for Embodiment the Invention**

The present invention is explained in more detail by referring to the following Reference Examples, Examples, Experimental Examples and Formulation Examples, which are not to be construed as limitative.

10 In the analysis values of the compound discussed in Examples, the melting point was measured using MP-500V (uncorrected) manufactured by Yanaco LID. Co., Ltd. The nuclear magnetic resonance spectrum (NMR) was measured using Gemini2000 manufactured by Varian. Inc. Elemental analysis was
15 performed using Vario EL type manufactured by Elementar Analysensysteme GmbH. The Matrix Assisted Laser Desorption Ionization - Time Of Flight Mass Spectrometry (MALDI-TOF MS) was measured using Voyager DE PRO manufactured by PerSeptive Biosystems, Inc. The specific rotation ($[\alpha]_D$) was measured
20 using SEPA-2000 manufactured by Horiba, Ltd.

Reference Example 1 homo-L-phenylalaninol (Reference compound 1)

To a solution (200 mL) of lithium borohydride (3.6 g, 170 mmol) in tetrahydrofuran was added trichloromethylsilane
25 (36 g, 340 mmol) under ice-cooling, and the mixture was stirred for 30 min. To this solution was slowly added homo-L-phenylalanine (10 g, 56 mmol) under the same conditions and the mixture was stirred for 18 hr. To this solution was added methanol until generation of a hydrogen gas stopped. After
30 concentration under reduced pressure, 5% aqueous sodium hydroxide solution was added and the mixture was extracted twice with dichloromethane. The organic layer was dried over anhydrous magnesium sulfate and concentrated under reduced pressure to give Reference compound 1 (9.2 g, 97%) as a white

solid.

Reference Example 7 N-(benzyloxycarbonyl)-L-phenylalaninol

(Reference compound 7)

To a solution (250 mL) of L-phenylalaninol (25 g, 170 mmol) in tetrahydrofuran were added N-carbobenzoxysuccinimide (41 g, 170 mmol) and triethylamine (25 g, 250 mmol) under ice-cooling. This solution was stirred at room temperature for 18 hr. This was concentrated under reduced pressure and the residue was dissolved in ethyl acetate. This solution was washed with 1M hydrochloric acid, saturated aqueous sodium hydrogen carbonate solution and saturated brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure. The residue was crystallized from hexane to give Reference compound 7 (41 g, 87%) as colorless crystals.

Reference Example 12 N-(benzyloxycarbonyl)-O-methyl-L-tyrosine methyl ester (Reference compound 12)

15 To a solution (20 mL) of Reference compound 11 (1.5 g, 4.6 mmol) in acetone were added anhydrous potassium carbonate (1.3 g, 9.1 mmol) and dimethylsulfuric acid (0.60 g, 4.6 mmol) and this solution was refluxed for 4 hr. The mixture was allowed to return to room temperature and water (1.0 mL) was
20 added thereto. To decompose remaining dimethylsulfuric acid, the mixture was stirred for 2 hr. The inorganic materials were filtered off and acetone was evaporated under reduced pressure. The residue was dissolved in dichloromethane, and this solution was washed with water, dried over anhydrous magnesium
25 sulfate and concentrated under reduced pressure to give Reference compound 12 (1.4 g, 90%) as a white solid.

mp 83.9–87.9°C. ¹H-NMR (300 MHz, DMSO-*d*₆)δ:2.80 (dd, 1H, *J* = 13.5, 10.5 Hz), 2.97 (dd, 1H, *J* = 13.4, 5.0 Hz), 3.62 (s, 3H), 3.72 (s, 3H), 4.22 (m, 1H), 4.99 (s, 2H), 6.84 (d, 2H, *J* = 8.4

Reference Example 13 N-(benzyloxycarbonyl)-O-butyl-L-tyrosine methyl ester (Reference compound 13)

To a solution (70 mL) of Reference compound 11 (18 g, 55

mmol) in N,N-dimethylformamide were added anhydrous potassium carbonate (15 g, 110 mmol) and n-butyl bromide (11 g, 82 mmol). This solution was stirred at room temperature for 18 hr. The inorganic substance was filtered off and the filtrate was concentrated under reduced pressure. This residue was dissolved in ethyl acetate, and the solution was washed with 1M hydrochloric acid and saturated brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure to give Reference compound 13 (20 g, 95%) as a colorless oil.

¹H-NMR (300 MHz, DMSO-*d*₆) δ: 0.93 (t, 3H, *J* = 7.2 Hz), 1.37-1.49 (m, 2H), 1.63-1.72 (m, 2H), 2.79 (dd, 1H, *J* = 13.5, 10.2 Hz), 2.97 (dd, 1H, *J* = 13.7, 5.0 Hz), 3.57-3.62 (m, 3H), 3.92 (t, 2H, *J* = 6.5 Hz), 4.21 (m, 1H), 4.99 (s, 2H), 6.81-6.84 (m, 2H), 7.12-7.15 (m, 2H), 7.26-7.38 (m, 5H), 7.78 (d, 1H, *J* = 8.1 Hz).

Reference Example 14 N-(benzyloxycarbonyl)-O-cyclohexylmethyl-L-tyrosine methyl ester (Reference compound 14)

Operations in the same manner as in Reference Example 13 and using methylcyclohexane bromide instead of n-butyl bromide afforded Reference compound 14 as a colorless oil.

¹H-NMR (300 MHz, DMSO-*d*₆) δ: 0.96-1.81 (m, 11H), 2.77 (m, 1H), 2.93 (m, 1H), 3.56-3.63 (m, 3H), 3.73 (d, 2H, *J* = 5.7 Hz), 4.19 (m, 1H), 4.97-4.98 (m, 2H), 6.65-6.83 (m, 2H), 7.01-7.14 (m, 2H), 7.28-7.32 (m, 5H), 7.74-7.79 (m, 1H).

Reference Example 15 N-(benzyloxycarbonyl)-L-tyrosinol (Reference compound 15)

To a solution (100 mL) of Reference compound 11 (18 g, 55 mmol) in tetrahydrofuran were added anhydrous lithium chloride (7.0 g, 160 mmol) and sodium borohydride (6.2 g, 160 mmol). Ethanol (200 mL) was further added and the mixture was stirred for 18 hr. The reaction mixture was adjusted to pH 4 by adding 10% citric acid, and tetrahydrofuran was evaporated under reduced pressure. The resulting product was extracted with dichloromethane, and the solution was dried over anhydrous magnesium sulfate and concentrated under reduced

pressure. The residue was crystallized from hexane to give Reference compound 15 (16 g, 91%) as colorless crystals.

mp 66.9–68.2°C. ¹H-NMR (300 MHz, DMSO-*d*₆) δ: 2.46 (m, 1H), 2.72 (dd, 1H, *J* = 14.0, 5.0 Hz), 3.34 (m, 1H), 3.51–3.61 (m, 2H),
5 4.69 (t, 1H, *J* = 5.3 Hz), 4.96 (dd, 2H, *J* = 17.4, 12.6 Hz), 6.63–6.67 (m, 2H), 6.97–7.04 (m, 3H), 7.25–7.37 (m, 5H), 9.13 (s, 1H). Anal. Calcd for C₁₇H₁₉NO₄: C, 67.76; H, 6.36; N, 4.65. Found: C, 67.09; H, 6.32; N, 4.54.

Reference Example 16 N-(benzyloxycarbonyl)-O-methyl-L-tyrosinol (Reference compound 16)

Operations in the same manner as in Reference Example 15 and using Reference compound 12 instead of Reference compound 11 afforded Reference compound 16 as colorless crystals.

Reference Example 19 N-(9-fluorenylmethoxycarbonyl)-2-fluoro-
L-phenylalaninol (Reference compound 19)

To a solution (30 mL) of Reference compound 3 (3.0 g, 18
10 mmol) in tetrahydrofuran were added N-(9-
fluorenylmethoxycarbonyloxy)succinimide (Fmoc-OSu) (6.0 g, 17
mmol) and triethylamine (2.7 g, 27 mmol) and the mixture was
stirred at room temperature for 18 hr. This was concentrated
under reduced pressure and the residue was dissolved in ethyl
15 acetate. This solution was washed with 1M hydrochloric acid,
saturated aqueous sodium hydrogen carbonate solution and
saturated brine, dried over anhydrous magnesium sulfate and
concentrated under reduced pressure. The residue was washed
with water and methanol solution to give Reference compound 19
20 (6.9 g, 49%) as colorless crystals.

Reference Example 20 N-(9-fluorenylmethoxycarbonyl)-2-chloro-

30 **Reference Example 24** N^α-benzyloxycarbonyl-N^ε-benzoyl-L-lysinoil (Reference compound 24)

To Reference compound 23 (6.3 g, 17 mmol) was added a solution (5.0 mL) of 20% trifluoroacetic acid/dichloromethane under ice-cooling. This solution was stirred at room

temperature for 18 hr. The solvent was evaporated under reduced pressure and chloroform was added. This was again evaporated under reduced pressure. The residue was suspended in ethyl acetate (100 mL), and benzoyl chloride (2.4 g, 17 mmol) and triethylamine (5.2 g, 51 mmol) were added. This solution was stirred at room temperature for 3 hr, washed with 1M hydrochloric acid, saturated aqueous sodium hydrogen carbonate solution and saturated brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure. The residue was purified by column chromatography [column; UltraPack silica gel 300 mmx37 mm (manufactured by YAMAZEN CORPORATION), eluent; ethyl acetate:hexane=2:1] to give Reference compound 24 (1.1 g, 18%) as colorless crystals.

¹H-NMR (300 MHz, DMSO-d₆) δ: 1.24-1.59 (m, 6H), 3.22-3.43 (m, 5H), 4.60 (t, 1H, J = 5.6 Hz), 5.00 (s, 2H), 6.95 (d, 1H, J = 9.2 Hz), 7.29-7.53 (m, 8H), 7.81-7.84 (m, 2H), 8.42 (m, 1H).

Reference Example 25 N-(benzyloxycarbonyl)-L-phenylalaninal (Reference compound 25)

Reference compound 7 (40 g, 140 mmol) was dissolved in dimethyl sulfoxide (160 mL) and dichloromethane (80 mL) and the mixture was ice-cooled. Thereto was added a suspension (80 mL) of N,N-diisopropylethylamine (54 g, 420 mmol) and sulfur trioxide pyridine complex (67 g, 420 mmol) in dimethyl sulfoxide. This solution was stirred under ice-cooling for 30 min. This reaction mixture was diluted with ethyl acetate, washed with 1M hydrochloric acid, saturated aqueous sodium hydrogen carbonate solution and saturated brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure. The residue was crystallized from a hexane/ethyl acetate mixed solution to give Reference compound 25 (30 g, 76%) as colorless crystals.

Reference Example 54 (1R)-1-(2,5-dioxolanyl)-2-phenylethylamine (Reference compound 54)

Operations in the same manner as in Reference Example 51 and using Reference compound 41 instead of Reference compound 38 afforded Reference compound 54 as a colorless oil.

¹H-NMR (300 MHz, DMSO-*d*₆) δ: 1.25 (s, 2H), 2.44 (dd, 1H, *J* = 13.2, 9.3 Hz), 2.79 (dd, 1H, *J* = 13.4, 4.4 Hz), 2.88 (m, 1H), 3.79-3.97 (m, 4H), 4.61 (d, 1H, *J* = 3.9 Hz), 7.15-7.31 (m, 5H).

Reference Example 55 (1S)-1-(2,5-dioxolanyl)-2-(4-hydroxyphenyl)ethylamine (Reference compound 55)

Operations in the same manner as in Reference Example 51 and using Reference compound 42 instead of Reference compound 38 afforded Reference compound 55 as a colorless oil.

¹H-NMR (300 MHz, DMSO-*d*₆) δ: 2.34 (dd, 1H, *J* = 13.5, 9.0 Hz), 2.67 (m, 1H), 2.81 (m, 1H), 3.78-3.95 (m, 4H), 4.58 (d, 1H, *J* = 3.9 Hz), 6.65-6.69 (m, 2H), 6.98-7.03 (m, 2H).

Reference Example 56 (1S)-1-(2,5-dioxolanyl)-2-(4-methoxyphenyl)ethylamine (Reference compound 56)

Operations in the same manner as in Reference Example 51 and using Reference compound 43 instead of Reference compound 38 afforded Reference compound 56 as a colorless oil.

¹H-NMR (300 MHz, DMSO-*d*₆) δ: 2.39 (dd, 1H, *J* = 13.5, 9.0 Hz), 2.72 (dd, 1H, *J* = 13.5, 4.5 Hz), 2.83 (m, 1H), 3.72 (s, 3H), 3.76-3.98 (m, 4H), 4.59 (d, 1H, *J* = 3.9 Hz), 6.81-6.86 (m, 2H), 7.11-7.16 (m, 2H).

Reference Example 57 (1S)-2-(4-butoxyphenyl)-1-(2,5-dioxolanyl)ethylamine (Reference compound 57)

Operations in the same manner as in Reference Example 51 and using Reference compound 44 instead of Reference compound

38 afforded Reference compound 57 as a colorless oil.

¹H-NMR (300 MHz, DMSO-*d*₆) δ: 0.96 (t, 3H, *J* = 7.4 Hz), 1.40-1.52 (m, 2H), 1.66-1.75 (m, 2H), 2.43 (dd, 1H, *J* = 9.2, 13.7 Hz), 2.75 (dd, 1H, *J* = 13.5, 4.5 Hz), 2.87 (m, 1H), 3.79-3.86 (m, 2H), 3.89-4.02 (m, 4H), 4.63 (m, 1H), 6.84-6.87 (m, 2H), 7.13-7.16 (m, 2H).

Reference Example 58 (1S)-2-(4-(cyclohexylmethoxy)phenyl)-1-(2,5-dioxolanyl)ethylamine (Reference compound 58)

Operations in the same manner as in Reference Example 51 and using Reference compound 45 instead of Reference compound 38 afforded Reference compound 58 as a colorless oil.

¹H-NMR (300 MHz, DMSO-*d*₆) δ: 0.96-1.31 (m, 6H), 1.63-1.81 (m, 5H), 2.37 (dd, 1H, *J* = 13.2, 9.0 Hz), 2.70 (dd, 1H, *J* = 13.5, 4.5 Hz), 2.81 (m, 1H), 3.71-3.73 (m, 2H), 3.75-3.98 (m, 4H), 4.58-4.59 (m, 1H), 6.80-6.83 (m, 2H), 7.09-7.12 (m, 2H).

Reference Example 59 (1S)-1-(2,5-dioxolanyl)-2-(2-fluorophenyl)ethylamine (Reference compound 59)

Reference compound 46 (0.80 g, 1.8 mmol) was dissolved in piperidine (5.0 mL) and this was stirred at room temperature for 18 hr and concentrated under reduced pressure. The residue was purified by column chromatography (column: silica gel 60N (40 - 50mesh), eluent: dichloromethane/methanol/water (9:1:0.1)) to give Reference compound 59 (0.20 g, 51%) as a colorless oil.

¹H-NMR (300 MHz, DMSO-*d*₆) δ: 1.28 (s, 2H), 2.47 (m, 1H), 2.83 (m, 1H), 3.80-3.96 (m, 5H), 4.65 (d, 1H, *J* = 3.6 Hz), 6.99-7.15 (m, 4H).

Reference Example 60 (1S)-2-(2-chlorophenyl)-1-(2,5-dioxolanyl)ethylamine (Reference compound 60)

Operations in the same manner as in Reference Example 59 and using Reference compound 47 instead of Reference compound 46 afforded Reference compound 60 as a colorless oil.

¹H-NMR (300 MHz, DMSO-*d*₆) δ: 1.34 (brs, 2H), 2.57 (m, 1H), 2.96 (m, 1H), 3.75-3.97 (m, 5H), 4.69 (d, 1H, *J* = 3.6 Hz), 7.19-

7.42 (m, 4H).

Reference Example 61 (1S)-2-benzyloxy-1-(2,5-dioxolanyl)ethylamine (Reference compound 61)

Operations in the same manner as in Reference Example 59 and using Reference compound 48 instead of Reference compound 46 afforded Reference compound 61 as a colorless oil.

Reference Example 62 (1S)-2-(4-biphenyl)-1-(2,5-dioxolanyl)ethylamine (Reference compound 62)

Operations in the same manner as in Reference Example 59 and using Reference compound 49 instead of Reference compound 46 afforded Reference compound 62 as a colorless oil.

¹H-NMR (300 MHz, DMSO-d₆)δ: 1.37 (s, 2H), 2.49 (m, 1H), 2.83 (dd, 1H, J = 13.2, 4.2 Hz), 2.92 (m, 1H), 3.78-4.00 (m, 4H), 4.65 (m, 1H), 7.31-7.66 (m, 9H).

Reference Example 63 (1S)-5-(benzoylamino)-1-(2,5-dioxolanyl)pentylamine (Reference compound 63)

Operations in the same manner as in Reference Example 59 and using Reference compound 50 instead of Reference compound 38 afforded Reference compound 63 as a colorless oil.

¹H-NMR (300 MHz, DMSO-d₆)δ: 1.13-1.57 (m, 6H), 2.54-2.60 (m, 1H), 3.22-3.28 (m, 2H), 3.76-3.90 (m, 4H), 4.55 (d, 1H, J = 4.3 Hz), 7.43-7.54 (m, 3H), 7.83 (d, 2H, J = 7.8 Hz), 8.43 (t, 1H, J = 5.0 Hz).

Reference Example 64 (2S)-N-((1S)-1-(2,5-dioxolanyl)-2-phenylethyl)-2-hydroxy-4-methylpentanamide (Reference compound 64)

Reference compound 51 (15 g, 78 mmol), L-leucic acid (10 g, 78 mmol), 1-hydroxybenzotriazole (12 g, 85 mmol) and triethylamine (8.6 g, 85 mmol) were dissolved in N,N-dimethylformamide (120 mL). Thereto was added a suspension (40 mL) of 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride (16 g, 85 mmol) in dichloromethane under ice-cooling. This solution was stirred at room temperature for 18 hr and concentrated under reduced pressure. The residue was

diluted with ethyl acetate and this solution was washed with 1M hydrochloric acid, saturated aqueous sodium hydrogen carbonate solution and saturated brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure. The
5 residue was crystallized from ethyl acetate to give Reference compound 64 (18 g, 75%) as colorless crystals.

Example 1 (2S,5S)-5-benzyl-6-hydroxy-2-(2-methylpropyl)-3-morpholinone (compound 1)

To a solution (150 mL) of Reference compound 64 (2.0 g, 6.5 mmol) in tetrahydrofuran was added 6M hydrochloric acid (150 mL). This solution was stirred at room temperature for 18 hr. Tetrahydrofuran was removed under reduced pressure, and the solution was extracted with ethyl acetate. The organic layer was washed with saturated aqueous sodium hydrogen

carbonate solution and saturated brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure. The residue was purified by HPLC system [column; YMC-Pack ODS-A 250x20 mm (manufactured by YMC Co., Ltd.), eluent; 5 acetonitrile/water/trifluoroacetic acid=30:70:0.1]. The main fractions were collected and extracted with ethyl acetate. The organic layer was washed with saturated aqueous sodium hydrogen carbonate solution and saturated brine, dried over anhydrous magnesium sulfate, and concentrated under reduced 10 pressure. The residue was crystallized from hexane/acetone mixture to give Compound 1 (0.50 g, 29%) as colorless crystals. mp 84.0–84.5°C. ¹H-NMR (300 MHz, DMSO-*d*₆) δ: 0.88 (d, 3H, *J* = 6.6 Hz), 0.90 (d, 3H, *J* = 7.2 Hz), 1.44 (m, 1H), 1.59 (m, 1H), 1.79 (m, 1H), 2.71–2.81 (m, 2H), 3.37 (m, 1H), 4.09 (dd, 1H, *J* = 9.8, 3.5 Hz), 4.84 (d, 1H, *J* = 4.1 Hz), 6.65 (d, 1H, *J* = 4.1 Hz), 7.17–7.34 (m, 5H), 7.79 (d, 1H, *J* = 4.5 Hz). Experimental Example 1 Determination of μ -calpain and m-calpain inhibitory activity

The μ -calpain and m-calpain inhibitory activities were determined according to the method described in a reference [Anal. Biochem. vol. 208, 387-392 (1993)]. To be specific, a reaction mixture (200 μ L) containing 0.5 mg/mL casein, 50 mM Tris-HCl buffer (pH 7.4), 20 mM dithiothreitol and 0.03 enzyme unit of μ -calpain (derived from human erythrocyte, manufactured by Cosmo Bio Co., Ltd.) or m-calpain (derived from pig kidney, manufactured by Cosmo Bio Co., Ltd.), dimethyl sulfoxide solution (2.5 μ L) containing various concentrations of a test drug and 20 mM aqueous calcium chloride solution (50 μ L) were added to a 96 well plate. After reaction at 30°C for 60 min, the reaction mixture (100 μ L) was transferred to a different 96 well plate, and purified water (50 μ L) and 50% Coomassie brilliant blue solution (100 μ L) were added. The plate was left standing at room temperature for 15 min and absorbance at 595 nm was measured. Using a value, measured after treating in the same manner without a test drug, as a control and a value, obtained by adding 1 mM EDTA instead of 20 mM aqueous calcium chloride solution, as a blank value, an inhibitory rate was calculated from the following formula and the amount (IC_{50}) necessary for 50% inhibition was determined.

Inhibitory rate (%) = $\{1 - (\text{measured value} - \text{blank value}) / (\text{control value} - \text{blank value})\} \times 100$

Test Results 1

The results thereof are shown in Table 1.

5 As a result, the compound of the present invention showed a superior calpain inhibitory activity.

Experimental Example 2 Lens opacity preventive action in xylose induced rat lens culture

Male SD rats (5-week-old) were sacrificed, and the
10 lenses were enucleated in a basic culture solution [Eagle's serum-free minimum essential medium (MEM, GIBCO) containing 10% fetal bovine serum (FBS, GIBCO)]. The enucleated lenses were divided into 3 groups, and cultured as follows (37°C, 5% CO₂).

- 15 (1) For normal group, the lens was cultured in this basic culture solution throughout the experiment period.
- (2) For control group, the lens was cultured in a basic culture solution supplemented with 30 mM xylose.
- (3) For drug group, the lens was cultured in a basic culture
20 solution supplemented with 30 mM xylose and 100 μ M compound 1 (drug added basic culture solution).

After 3 days of culture, (2) was changed to a basic

culture solution without xylose and (3) was changed to a drug added basic culture solution without xylose, and culture was continued for 11 days. After the completion of the culture, the lens images were loaded into a computer using a video camera under a stereoscopic microscope, and the opacity of the lens center was measured by image analysis.

Test Results 2

The results are shown in Fig. 1. The lens of the normal group was transparent. The lens of the control group was opacified white at the center. In the group added with Compound 1 (drug group), the opacity was significantly suppressed.

The above results suggest that Compound 1 of the present invention is effective for the suppression of xylose-induced cataract.

Experimental Example 3 Cornea permeability test

Rabbits were sacrificed with pentobarbital, and the eyeballs were enucleated. The cornea cut out by circumcission (about 5 mm on the sclera side from corneal limbal of the enucleated eyeballs) along the limbal was set on a side-by-side type cornea permeation test tool. For donor cell and receptor cell, the eye drop of Formulation Example 4 to be mentioned later and a buffer containing the following ingredients were respectively added. The cells in this tool were incubated at 34°C for 3 hr, receptor cells were sampled with the lapse of time, and the concentration of the permeated compound 1 was quantitatively determined by high performance liquid chromatography.

(Ingredients of receptor cell buffer)

calcium chloride	0.132 g
potassium chloride	0.4 g
magnesium sulfate 7 hydrate	0.2 g
sodium dihydrogen phosphate dihydrate	0.187 g
sodium chloride	7.87 g

glucose	1.0	g
pH	7.2	
sterile purified water	suitable amount	
total amount	1000	mL

5

From the results of the quantitative determination by high performance liquid chromatography, the linear part of the accumulated permeation amount curve relative to time is regarded as a steady state, the slope was determined as permeation rate (dQ/dt), and apparent permeability coefficient (P) was calculated by the following formula.

$$P = (dQ/dt) \times (1/\Delta C)$$

P: apparent permeability coefficient (cm/s)

ΔC : drug concentration in donor cell

15 Test Results 3

The apparent permeability coefficient (P) of compound 1 was 1.9×10^{-5} cm/s.

Experimental Example 4 Effect on rat retinal ischemic disorder

Male SD rats (body weight: 150-200 g, purchased from Charles River Japan, Inc.) were used. For anesthesia, a mixture of equivalent amounts of 50 mg/mL ketamine injection and 20 mg/mL xylazine injection was administered intramuscularly at 1.0 mL/kg body weight into the femora of the rats 15 min before ischemia. To achieve ischemia, the optic nerve including central retinal artery was ligated using a Sugita Clip minitype (No. 98), and the blood flow was blocked for 55 min. For normal group, central retinal artery was only exposed and ischemia was not set up. After 7 days from reperfusion in ischemia, a tissue specimen was prepared. For preparation of the tissue specimen, an excess amount of pentobarbital solution was intraperitoneally administered to sacrifice the animal, and left eyeball was enucleated. The enucleated eyeball was fixed for 24 hr in a fixing solution of 2% paraformaldehyde and 2.5% glutaraldehyde (0.1 M phosphate

buffer, pH 7.4). After fixing, a paraffin embedded block was prepared, sliced in a thickness of 3 μ m at the section passing through the center of the optic disc and stained with hematoxylin and eosin (HE). Ganglion cells of retina per 0.25 mm width of the retina section at 1-2 mm from the center of the optic disc were counted under an optical microscope. A solution obtained by dissolving sodium carboxycellulose in distilled water to a concentration of 0.5% (CMC solution) was orally administered to the control group, and a solution obtained by suspending Compound 1 in a CMC solution at 1.0%, such that Compound 1 was administered at 100 mg/kg body weight, was orally administered to the drug group, both at 15 min before start of ischemia and immediately after release from ischemia.

15 Test Results 4

The results thereof are shown in Fig. 2. The ganglion cell count decreased to about 1/4 of that of the normal group (control group) due to ischemia. In contrast, Compound 1 administration (drug group) significantly suppressed the decrease due to ischemia in the ganglion cell count.

The above results suggest that Compound 1 of the present invention has an effect to improve retinal ischemic disorder.

Experimental Example 5 Reverse mutation test

A reverse mutation test was performed using 5 strains of *Salmonella typhimurium* TA98 strain, TA1537 strain, TA100 strain, TA1535 strain and *Escherichia coli* WP2uvrA strain by a preincubation method (Maron, D.M. and Ames, B.N.: Mutation Res., 113, 173-215, 1983) [-(S9)Mix]. A similar test was simultaneously performed under the conditions including addition of a metabolism activation system [a supernatant fraction (S9)Mix obtained by intraperitoneally administering phenobarbital (4 days before anatomy 0.03 g/kg, 3, 2, 1 day(s) before anatomy 0.06 g/kg) and 5,6-benzoflavone (2 days before anatomy 0.08 g/kg) to 7-week-old Sprague Dawley rats,

enucleating the liver, preparing a homogenate and centrifugal separation at 9000xg] [(S9)Mix]. As a solvent of compound 1 and as a negative control, dimethyl sulfoxide was used.

Test Results 5

5 (1) Dose setting test

The highest 131 (15.8 µg/plate) and the lowest 115 (158 µg/plate) in TA100 strain [-(S9)Mix] of compound 1 were less than two times the negative control value (119) in every dose. Similarly, the numbers of reverse mutation colonies of TA100
10 strain [(S9)Mix] and other 4 bacterial strains [-/(S9)Mix] were less than two times the negative control value in every dose.

(2) Main test

The highest 147 (78.1 µg/plate) and the lowest 110 (125
15 µg/plate) in TA100 strain [-(S9)Mix] of compound 1 were less than two times the negative control value (132) in every dose. Similarly, the numbers of reverse mutation colonies of TA100 strain [(S9)Mix] and other 4 bacterial strains [-/(S9)Mix] were less than two times the negative control value in every
20 dose.

From the above results, since compound 1 did not show the number of reverse mutation colonies that exceeded twice the negative control value at any dose in both the dose setting test and the main test, it was concluded that compound
25 1 is free of mutagenicity in bacteria in the total of 5 bacterial strains of *Salmonella typhimurium* and *Escherichia coli*.

Formulation Example 1 tablet

Compound 5	5.0	g
30 Starch	12.0	g
Lactose	27.2	g
Magnesium stearate	0.4	g

Compound 5, lactose and starch were thoroughly admixed

to give granules for tableting according to a wet tablet preparation method. Magnesium stearate was added and the mixture was tableted to give 400 tablets. The tablets are coated with enteric coating agent (methacrylic acid copolymer),
5 as necessary.

The above components are aseptically admixed by a conventional method to give an eye drop.

Industrial Applicability

Since the compound represented by the formula (I) of the present invention has a superior calpain inhibitory activity, it is useful as a drug for the prophylaxis or treatment of
5 various diseases, in which calpain is involved, such as ischemic disease, immune disease, Alzheimer's disease, osteoporosis, disease arising from brain tissue disorder, cataract, glaucoma, retinoblastoma, complications of posterior segment of the eye arising from photocoagulation, a
10 disease associated with angiogenesis and the like.

While some of the specific embodiments of this invention have been described in detail in the foregoing, it will be possible for those of ordinary skill in the art to variously
15 modify and change the particular embodiments shown herein, within the scope not substantially deviating from the novel teaching and benefit of the invention. Accordingly, this invention encompasses all such modifications and changes within the spirit and scope of the invention as defined by the
20 following claims.

This application is based on a patent application No. 2002-097186 filed in Japan, the contents of which are hereby incorporated by reference.
